

WilComm for SAP Business One

WilComm Document Output Management for SAP Business One

8 January 2007, Melbourne – Wilkinson Electronic Document Solutions today announced the release of the WilComm document output management solution for SAP Business One.

Whilst ERP systems generally result in significant efficiencies throughout the supply chain, the process of creating and distributing purchase orders, delivery dockets, invoices and other supply chain documentation often remains an unsolved issue. WilComm extends the basic forms capabilities of SAP Business One to include sophisticated electronic document features, including an elegant, easy-to-use forms designer; automated print, email and fax distribution according to customer preferences; and automatic, digital filing or archiving for fast storage and retrieval.

The process for creating electronic forms with WilComm is simple: WilComm processes standard SAP Business One application output, without the need for any file format changes. An intuitive, WYSIWYG method of form design makes it easy to create forms in landscape and portrait format, draw boxes and tables with rounded corners, and also allows the dynamic display of graphics such as logos, signatures and barcodes. By simply mapping the data from the existing print job to the form variables, fields are populated automatically within the electronic form. Distribution rules then provide an automatic destination for each job: print, fax, email, file and archive or any combination of these. For maximum flexibility, forms may be output in TXT, PDF, CSV and XLS file formats.

WilComm for SAP Business One is modular by design and consists of the WilComm Server and a choice of service modules – print, fax, email, file and archive – and other optional software add-ons. A basic installation of the WilComm document output management solution includes WilComm Server and one service module.
